HF-1025WA

RichardsApex HF-1025WA is a colloidal dispersion of synthetic graphite in water. The combination of special wetting and bonding agents make it a unique lubricant on a variety of high temperature applications. When applied as a spray or dip to metal surfaces, **HF-1025WA** forms a tenacious graphite coating, which provides an efficient means for forming hot metal.

BENEFITS:

Forms a tenacious film

Excellent wetting of hot metal

Can be thinned with water

RECOMMENDED USES:

Recommended for use on extruding, forging and pressing of hot metal where a quality surface is required

Apply "as supplied", preferably by means of a spray

HF-1025WA is extremely efficient and the amount needed to provide a good lubricating film is extremely small

TYPICAL SPECIFICATIONS:

Specific Gravity 1.03

Solids Content 5%
